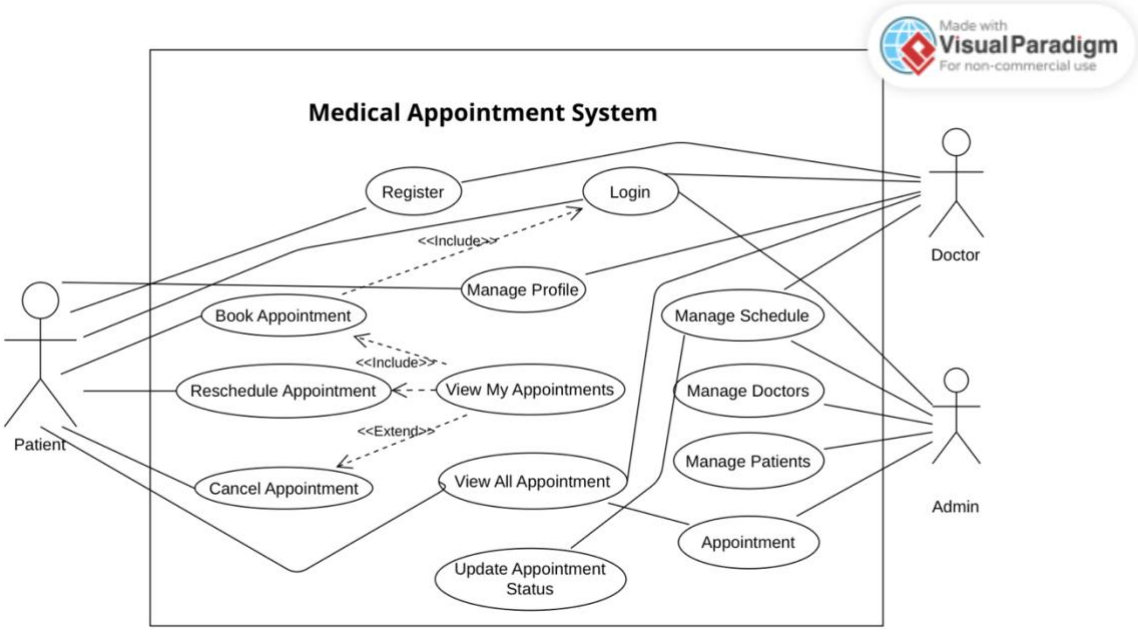
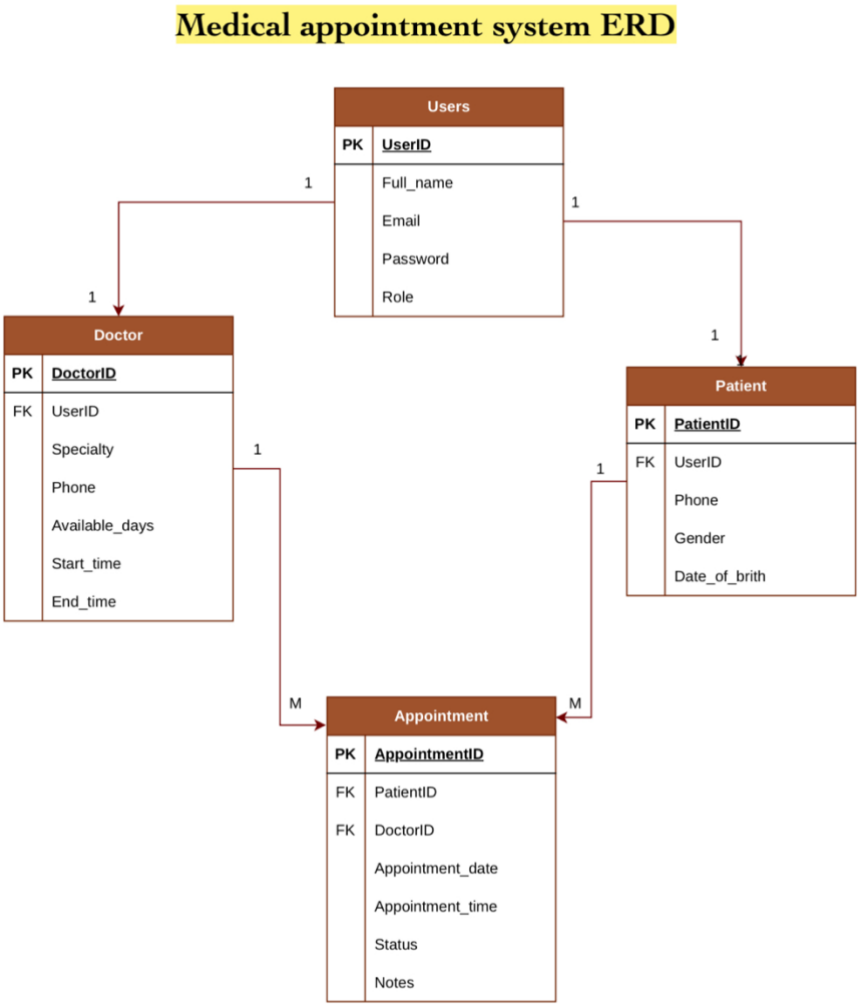
Week_3
System architecture design

Case diagram:



This chart shows the interactions between different users (patient, doctor, and administrator) with the medical appointment booking system. It shows the basic processes that each user can perform, such as booking an appointment, modifying or canceling appointments, managing personal files, as well as managing doctors and patients by the administrator. This scheme helps to understand the functions and limits of the system in general

Database schema ERD:



This scheme represents the basic structure of the database in the medical appointment booking system. It explains key entities such as users, doctors, patients, and appointments, as well as the relationships between them. This design aims to organize data logically that facilitates the process of storage and retrieval, and ensures the integration of data within the system

Tech stack:

The following technologies will be used to develop the system:
• Frontend: HTML, CSS, JavaScript
• Backend: PHP
• Database: MySQL
• Tools: GitHub for version control
• Design Tools: Figma (for UI/UX design)

These technologies were selected because they are simple, efficient, and suitable for building a web-based system..
